ECU555-80 Electronic Control Unit

Summary

The ECU555-80 electronic control unit is a rugged embedded control system capable operating in harsh automotive, marine, and off-highway applications. Over 300,000 successful marine applications prove the capability of this module. Based on a proven microprocessor, the ECU555-80 is capable of delivering complex control strategies. The onboard floating point unit and the high clock frequency allow software to be developed in shorter times. Dual CAN 2.0B datalinks ensure interoperability with other system components.

The ECU555-80 is part of the ControlCore family of embedded controls systems. Software for the ECU555-80 can be created by using traditional methods or using model based automatic code generation via the MotoHawk for Simulink product available from MotoTron.

Microprocessor: Motorola MPC555, 40MHz
Memory: 448K Flash, 26K RAM, 8K EEPROM
Operating Voltage: 9-16VDC
Operating Temperature: -40 to 105 C
(in benchmark marine engine application)
Sealed connectors operable to 10ft submerged.

Inputs:

- Up to 19 Analog Inputs
- 3 Low Frequency Digital Inputs
- 1 VR Frequency Input
- Up to 2 Hall Effect Frequency Inputs
- Up to 2 O2 () Sensor Inputs
- Dual Sensor Wide Band Knock Detection Input
- 1 Emergency Stop Input

Outputs:

- 12 3A Peak/1A Hold Injector Drivers
- 8 TTL Level Ignition System Outputs
- 6 10A Low Side PWM
- 2 5A H-Bridge PWM
- 1 Relay Driver (Main Power)
- 2 1.5 A Low Side PWM

Datalinks:

- 2 CAN 2.0B Channels
- 1 RS485 Channel

**1 INPUT SIGNAL CONDITIONING**

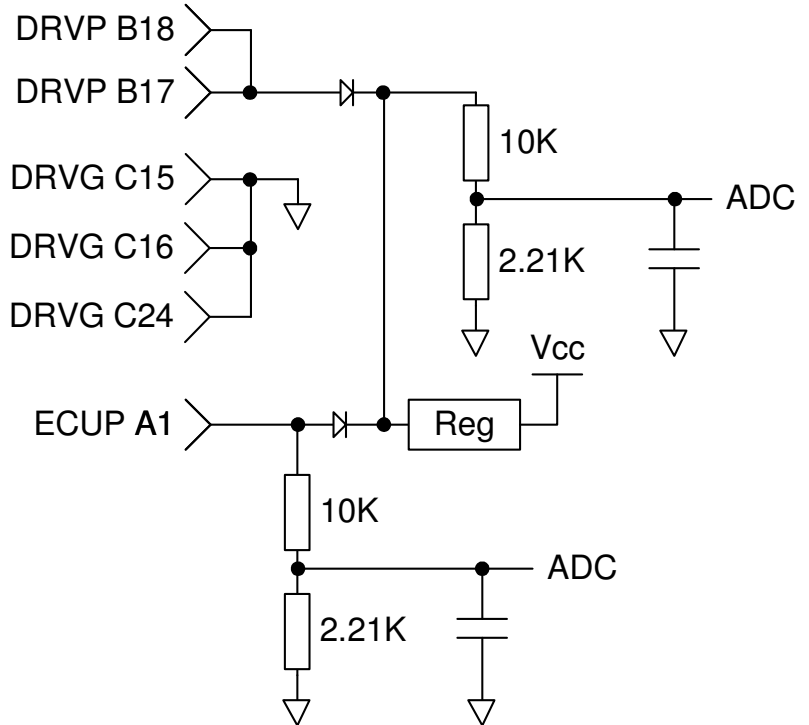

See Motorola MPC555 datasheet for description of processor resources.

1.1 ECUP (A1), DRVP (B17, B18), DRVG (C15, C16, C24)

Power (Key) switch input ECUP supplies module power to initiate the process under control. The DRVP inputs are wired to the Main Power Relay which will supply the process while the MPRD signal is asserted and will hold the module power on after the ECUP signal is removed until the MPRD signal is released by the application (see below). Inputs are monitored by the processor.

The DRVG inputs are the system (battery) ground connections.

**1.2 AN1M...AN3M,****(A3, A4, A5).**

These inputs are 10bit 0-5V ADC's, $\tau = 1\text{ms}$. They are intended for pressure sensors.

**1.3 AN4M...AN8M****(A6, A7, A8, A9, A10)**

These inputs are 10bit 0-5V ADC's, $\tau = 1\text{ms}$. They are intended for potentiometers.

**1.4 AN9M...AN12M****(A14, A15, A16, A17)**

These inputs are 10bit 0-5V ADC's, $\tau = 1\text{ms}$. They are intended for variable resistance sensors such as thermistors.

1.5 AN13M...AN14M

(A25, A26)

These inputs are 10bit 0-5V ADC's, $\tau = 1\text{ms}$. They are intended for variable resistance sensors.

1.6 AN15M

(A27)

This input is a 10bit 0-5V ADC, $\tau = 1\text{ms}$. This input is intended for a variable conductivity sensor such as a water in fuel sensor

1.7 AN16M, AN17M

(A2, A12)

These inputs are 10bit 0-5V ADC's, $\tau = 1\text{ms}$. They are intended for potentiometers.

Note:
Not available on units with O2 sensor interface.
See section 7.

1.8 AN18M

(A24)

This input is a 10bit 0-5V ADC's, $\tau = 1\text{ms}$. It is intended for a pressure sensor.

Note:
Not available on units with O2 sensor interface.
See section 7.

1.9 AN19M

(A13)

This input is a 10bit 0-5V ADC's, $\tau = 1\text{ms}$. It is intended for a variable resistance sensor.

Note:
Not available on units with O2 sensor interface.
See section 7.

1.10 O₂ (λ) Sensor Interface

O2ALO, O2AHI, O2BLO, O2BHI

(A24, A13, A12, A2)

Note:
Not available on units with analog inputs 16 to 19.
See section 7.

PCM0312

**1.11 DG1M****(B15)**Digital switch input. $V_{IL}=2.0V_{max}$. $V_{IH}=2.5V_{min}$, $\tau = 1ms$.**1.12 DG2M, DG4M****(B16, B3)**Digital switch input. $V_{IL}=2.0V_{max}$. $V_{IH}=2.5V_{min}$, $\tau = 5.1\mu s$.**1.13 STOP****(B23)**

This is the emergency stop input.

Switching to ground will disable the fuel pump and spark coil outputs.

Note:

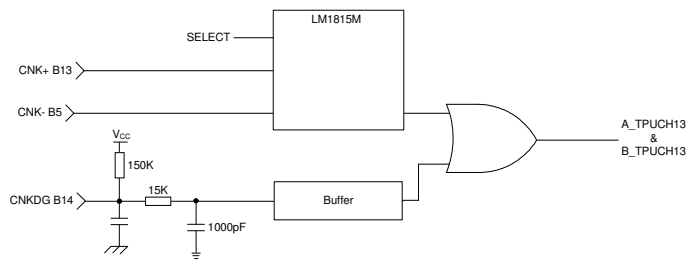

Loss of ECUP will also trigger the STOP function.

**1.14 CNK+, CNK-, CNK_DG****(B13, B5, B14)**

CNK+ and CNK- are variable reluctance sensor inputs.

CNK_DG is a switch input for a Hall Effect sensor or switch to ground.

Only one should be wired in at a time.

**1.15 CAM_DG****(B6)**

CAM_DG is a switch input for a Hall Effect sensor or switch to ground.

**1.16 EK0P, EK0N, EK1P, EK1N****(A29, A19, A30, A20)**

These inputs are for wide band piezoelectric knock sensors.

<h2>2 Output Signal Conditioning</h2>	
<h3>2.1 XDRP, XDRP_B</h3> <p>(A23, B24) These outputs are for powering sensor transducers. 5V 500mA max.</p>	
<h3>2.2 HSOL1, HSOL2</h3> <p>(C1, C19) These outputs are high current sink drivers, 10A max. Short circuit protection, open circuit and short circuit detection. Note: Not available on all models.</p>	
<h3>2.3 HSOL 3, HSOL4</h3> <p>(C9, C10) These outputs are high current sink drivers, 10A max. They include freewheeling diodes to DRVP, Short circuit protection, open circuit and short circuit detection. Note: Not available on all models.</p>	
<h3>2.4 ESC_A, ESC_B</h3> <p>(C17, C18) This is a 12 volt H-bridge output. 5A cont., 10A pk.</p>	

2.5 MPRD

(B4)

This output energizes the Main Power Relay. Short circuit protection, open circuit and short circuit detection.

2.6 START

(B8)

This output is a high current sink driver. 10A max. It includes a freewheeling diode to DRVP, short circuit protection, open circuit and short circuit detection.

2.7 OILP

(B7)

This output is a high current sink driver, 10A max. It includes a freewheeling diode to DRVP, short circuit protection, open circuit and short circuit detection.

2.8 TACH,

(B12)

This output is capable of sinking 1.5A max.

2.9 FUELP

(B11)

This output is capable of sinking 1.5A max. Note: The STOP signal (1.13) will disable the FUELP output when asserted.

2.10 ETC_A, ETC_B

(C4, C2)

This is a 12 volt H-bridge output. 5A cont., 6A pk.

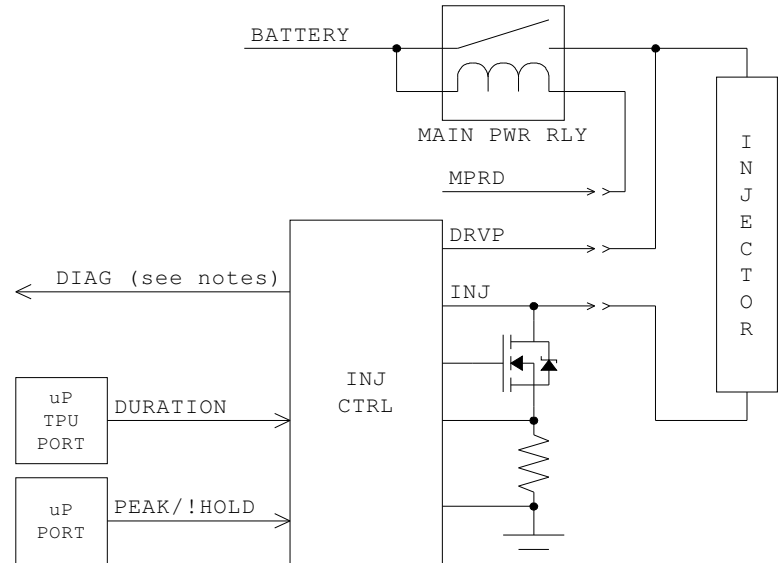

2.11 FI1D...FI6D, AI1D...AI6D

(C6, C11, B22, B20, C23, C21, C5, C3, B21, B19, C22, C20)

These outputs are injector coil drivers capable of sinking 3A pk. and 1A cont.

Notes:

When the injector output is on (duration), current is regulated to either the peak or hold level. Current regulation is implemented via a chopper drive and the recirculation path is via DRVP. If the output is off there is no leakage path to DRVP and flyback energy is dissipated via low-side avalanche. AI1D and AI2D may be used for FI7D and FI8D respectively. Injector trace shown below: 1A=470mV.

2.12 EST1...EST8

(B2, C8, B10, C7, B9, C12, C13, C14)

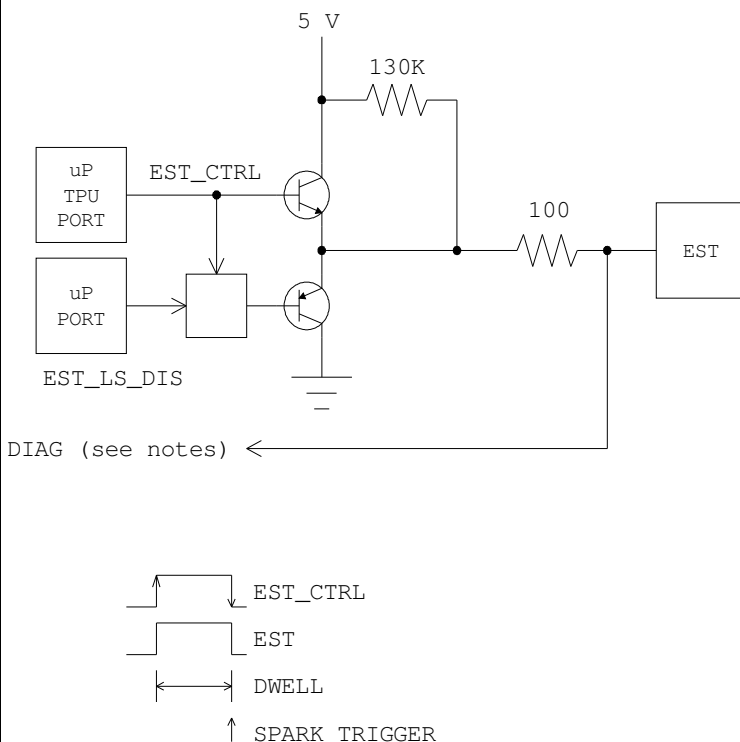

These are TTL level outputs.

Note:

Since EST_RTN (2.13) is a direct path to the ECU ground care must be taken not to introduce ground loops. EST_RTN is not designed to carry any significant current; it is a reference only. It should be open circuit unless the smart coil electronics

provides an isolated logic ground reference.

Care must also be taken not to introduce noise on EST_RTN. Electrical transients on EST_RTN can cause module upsets. The STOP signal (1.13) will disable these outputs when asserted.

2.13 EST_RTN

(B1)

Low current ground reference for SmartCoils

3 COMMUNICATIONS

3.1 CAN1+, CAN1-

(A11, A21)

Note:

CAN1 may also be used for programming the unit.

CAN 2.0B, Standard or Extended ID, 250Kbps.

3.2 CAN2+, CAN2-

(A31, A32)

CAN 2.0B, Standard or Extended ID, 250Kbps.

3.3 SCL+, SCL-

(A28, A18)

Note:

RS485 is also used for programming the unit. The function is disabled when applications use this channel.

RS485, programmable baud rate 1200 - 57600.
8 Bits, No parity, 1 Stop Bit

6 PHYSICAL DIMENSIONS

6.1 ALL DIMENSIONS ARE IN MILLIMETERS

7 ENVIRONMENTAL RATINGS

7.1 GENERAL

The ECU is designed to meet automotive industry standard under hood environmental requirements for 12 volt systems, and also meets marine industry environmental requirements.

Validation tests included extreme operating temperatures (-40 to 105C), thermal shock, humidity, salt spray, salt fog, immersion, fluid resistance, mechanical shock, vibration, and EMC.

It is the responsibility of the application engineer to assure that the application does not exceed the demonstrated capabilities of the unit; vibration or thermal. It may be necessary to perform additional tests to validate the unit in the application.

7.2 VIBRATION:

Engine mountable and tested to high-performance levels, the ECU has been successfully deployed on engines having the vibration profiles shown at right:

Electrical and mechanical isolation is via a bushing, grommet, and washer, as shown below:

7.3 TRANSIENT POWER SPIKE RESISTANCE:

+/- 200 VDC
